What are steroids?

"Anabolic steroids" is the familiar name for synthetic substances related to the male sex hormones (androgens). They promote the growth of skeletal muscle (anabolic effects) & the development of male sexual characteristics (androgenic effects), & also have some other effects. The term "anabolic steroids" will be used through-out this report because of its familiarity, although the proper term for these compounds is "anabolic-androgenic" steroids.

Anabolic steroids were developed in the late 1930s primarily to treat hypogonadism, a condition in which the testes do not produce sufficient testosterone for normal growth, development, & sexual functioning. The primary medical uses of these compounds are to treat delayed puberty, some types of impotence, & wasting of the body caused by HIV infection or other diseases.

During the 1930s, scientists discovered that anabolic steroids could facilitate the growth of skeletal muscle in laboratory animals, which led to use of the compounds first by bodybuilders & weightlifters & then by athletes in other sports. Steroid abuse has become so widespread in athletics that it affects the outcome of sports contests.

More than 100 different anabolic steroids have been developed, but they require a prescription to be used legally in the United States. Most steroids that are used illegally are smuggled in from other countries, illegally diverted from U.S. pharmacies, or synthesized in clandestine laboratories.

What are steroidal supplements?

In the United States, supplements such as dehydroepian-drosterone (DHEA) and androstenedione (street name Andro) can be purchased legally without a prescription through many commercial sources including health food stores. They are often referred to as dietary supplements, although they are not food products. They are often taken because the user believes they have anabolic effects.

Steroidal supplements can be converted into testosterone (an important male sex hormone) or a similar compound in the body. Whether such conversion produces sufficient quantities of testosterone to promote muscle growth or whether the supplements themselves promote muscle growth is unknown.

Little is known about the side effects of steroidal supplements, but if large quantities of these compounds substantially increase testosterone levels in the body, they also are likely to produce the same side effects as anabolic steroids.

Bodybuilding

Steroids have been used in bodybuilding since the early 50's & since then have been the common denominator between all the massive guys you see in the magazines and on stage. Big name bodybuilders like Arnold Swartzenegger have even admitted to using them, not that it wasn't obvious already. It is with an old pro wrestler named Rick Drason who used to work out with Arnold & some other big name bodybuilders. It isn't uncommon for a pro bodybuilder to use steroids year round and even at doses of over 1000mgs of testosterone weekly. Most of them, even at this dosage, experience very few side effects.

Bodybuilding is not the only professional sport where steroids are being used consistently. Swimmers, Rugby players, Basketball players, & especially pro Football players are often using steroids. Football great Lyle Alzado, who publicly blamed his cancer on steroids and growth hormone, claimed that 90%+ were using while he was in the game. While this number may seem a little extreme, it is certainly within the realm of reality.
