About Sustanon

Sustanon 250 is an oil-based injectable containing four different testosterone compounds: testosterone propionate , 30 mg; testosterone phenylpropionate , 60 mg; testosterone isocaproate, 60mg; and testosterone decanoate, 100 mg. The mixture of the testosterone are time-released to provide an immediate effect while still remaining active in the body for up to a month. As with other testosterone, Sustanon is an androgenic steroid with a pronounced anabolic effect. Therefore, athletes commonly use Sustanon to put on mass and size while increasing strength.

However, unlike other testosterone compounds such as testosterone cypionate and testosterone enanthate , the use of Sustanon leads to less water retention and estrogenic side effects. This characteristic is extremely beneficial to bodybuilders who suffer from gynecomastia yet still seek the powerful anabolic effect of an injectable testosterone. The decreased water retention also makes Sustanon a desirable steroid for bodybuilders and athletes interested in cutting up or building a solid foundation of quality mass. Dosages of Sustanon range from 250 mg every other week, up to 2000 mg or more per week. These dosages seem to be the extremes. A more common dosage would range from 250 mg to 1000 mg per week. Although Sustanon remains active for up to a month, injections should be taken at least once a week to keep testosterone levels stable.

Sustanon 250 is a trade name for an oil-based injectable blend of four esterized testosterone compounds:

- 30mg Testosterone Propionate
- 60mg Testosterone Phenylpropionate
- 60mg Testosterone Isocaproate
- 100mg Testosterone Decanoate

Sustanon 100 is similar, though with three esters. The smaller dose is for paediatric use.

- 20mg Testosterone Propionate
- 40mg Testosterone Phenylpropionate
- 40mg Testosterone Isocaproate

Unfortunately, Sustanon will also do all of the bad things that any form of testosterone is known for:

It will convert to the female hormone estrogen (via a mechanism known as aromatization) by the (you guessed it) aromatize enzyme. Excessive estrogen can lead to unwanted side effects , such as acne, the growth of breast tissue (gynecomastia), fat

gain and reduced fat breakdown, loss of sex drive, testicular shrinkage and water retention. Water retention can increase blood pressure weakening blood vessels over time. Unfortunately, this isn't all it does& it can also interact with the 5 alpha-reductase enzyme. This interaction converts the testosterone to Dihydro-testosterone (DHT), a more androgenic form of the parent hormone. DHT has a high binding affinity to the tissues of the scalp resulting in hair loss in users who suffer from male pattern baldness. DHT can affect the prostate as well, making it larger. This swelling can cause the gland to press against the bladder causing urinary problems. Drugs called 5alpha-reductase inhibitors can prevent these symptoms without blocking testosterone's anabolic effects.(8) Higher dosages of test can also negatively impact cholesterol, lowering HDL(9). Testosterone is probably the safest steroid around, but it can't be taken lightly, and Sustanon is no different.

Side Effects of Sustanon: The side effects of Sustanon are similar to those of Testosterone enanthate only that they are usually less frequent and less severe. Depending on the predisposition and dosage, the user can experience the usual androgenic linked side effects such as acne, aggressiveness, sexual overstimulation, oily skin, accelerated hair loss, and reduced production of the body's own hormones. Water retention and gynecomastia are usually within limits with the "Sustas" or are not as massive as with enanthate and cypionate. Liver damage is unlikely with Sustanon however, in very high dosages, elevated liver values can occur which, after discontinuing use of the compound, usually go back to normal.
