[The sport of bodybuilding](#)

The sport of bodybuilding is leading to bigger championships for local enthusiasts. Dana Ali, 31, who recently returned to Kurdistan from Britain, started lifting weights six year ago when he was abroad. "Oh, I became many pounds overweight," he said, taking a break after finishing the first set. "I see so many [overweight people] here, and I don't want to be like them. "I feel better and forget about all my problems when I come in and exercise," said Ali, having arrived straight from work wearing a black T-shirt and leather gloves. He works out five times a week and has shed most of his body fat; his chest and biceps are as thick as they were when he was living in Britain.

[Anabolic Steroid Dianabol Turns 50](#)

Substance: Boldenone Undeclynate
Manufactured by: Axiolabs
Packaging: 10ml vial contains 200mg/ml
Average Dose: 400-600mg/week(M) 50-150 mg/week(F)
Half Life: 14 - 16 days
Water Retention: Low
Aromatization: Mild
DHT Conversion: Low

Equiplex more known as trade name Equipoise. It is a favorite veterinary steroid of many athletes. Its effects are strongly anabolic, and only moderately androgenic. By itself, Equiplex will provide a steady and consistent gain in mass and strength. However, best results are achieved when Equipoise is used in conjunction with other steroids. Equipoise is a favorite veterinary steroid of many athletes. Its effects are strongly anabolic, and only moderately androgenic. By itself, Equiplex will provide a steady and consistent gain in mass and strength. However, best results are achieved when Equiplex is used in conjunction with other steroids. For mass, Equiplex stacks exceptionally well with Methanoplex, Oxyplex or an injectable testosterone like Sustaplex 325 or Testaplex C. Equiplex is also highly effective for contest preparation since it aromatizes very poorly. Muscle hardness and density can be greatly improved when Equiplex is combined with Enanthate or Winstrol. Average dosages of Equiplex are 200-600 mg per week. Injections are usually taken every other day. If high volume injections are made too frequently to the same injection site, an oil abscess may form. An oil abscess will often dissipate on its own, but in extreme instances, a doctor will need to drain it. Therefore, athletes should take caution and rotate injection sites. It is packed in multiple dose vial of 10 ml 200 mg per ml.

Use in doping

The activity of **Equiplex 200 (Boldenone Undeclynate)** is mainly anabolic, with a low androgenic potency. It has a very long half-life, and can show up on a steroid test for up to 5 months.

Equiplex 200 (Boldenone Undeclynate) will increase nitrogen retention, protein synthesis, increases appetite and stimulates the release of erythropoietin in the kidneys. The drug is commonly used in doping within bodybuilding, even though this use is illegal. If intended to assist in **bodybuilding**, the drug is taken as part of a steroid stack of other **anabolic steroids**, usually with a potent androgen like testosterone as the 'base' of the stack.

Equiplex 200 (Boldenone Undeclynate) is often used by bodybuilders in both off-season and pre-contest. Because it has similar properties to methandienone (methylated boldenone), it is a favorite for adding strength and size. Another reason Boldenone is so popular for bulking is because it increases the appetite; this is also a reason many athletes will stay away from it pre-contest. **Equiplex 200 (Boldenone Undeclynate)** is well known for increasing vascularity while preparing for a **bodybuilding** contest.

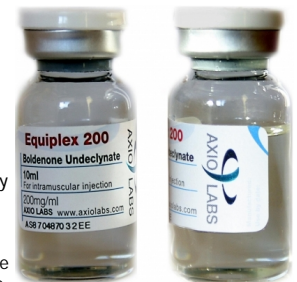

Common **bodybuilding** doses range between 200 mg to 400 mg/week but could be as high as 800 mg/week.

Equiplex 200 (Boldenone Undeclynate) has a low rate of aromatization (about 50% of Testosterone), which means it does not convert to estrogen easily and does not cause very much water retention. Many **Bodybuilders** will find that it is a good replacement drug for Nandrolone.

Equiplex 200 (Boldenone Undeclynate) is among the substances banned by Major League Baseball, as well as most other major athletic organizations.

It is easily detectable in blood tests due to its long metabolic half-life. Trace amounts of the drug can easily be detected for months after discontinued use.

The performance-enhancing drug Dianabol, which became the first widely used anabolic steroid and has built muscle for athletes and bodybuilders and become the subject of criminal prosecutions, was developed in 1958. There's a good piece in the New York Daily News looking at half a century of the steroid's use:
