PRIMOPLEX (Methenolone Enanthate) by Axiolabs

[Buy Now](#)**Primoplex 100** for intramuscular injection, contains methenolone enanthate

Methenolone Enanthate is a DHT based anabolic steroid. Known under the brand name of Primoplex® in tablet or injectable form.

When it interacts with the aromatase enzyme it does not form any estrogens. It is used by people who are very susceptible to estrogenic side effects, having lower estrogenic properties than Nandrolone. Methenolone is available as an injection or as an oral (primoplex). The injection is naturally regarded as having a higher bioavailability. Its an enanthate ester which is quite long-acting. Because it bypasses hepatic breakdown on the first pass, it also has a higher survival rate. The tablets are in a short-lived acetate form. Methenolone is not 17-alpha-alkylated, but 1-methylated for oral bioavailability. This reduces the stress on the liver, but also the availability. It is considered one of the safer steroids, meaning it has a very little side effects. Methenolone has no estrogenic side effects, and its effects on cholesterol levels are minimal. In doses of 200 mg or less (intramuscular) blood pressure is rarely altered.

Possibly one of the safer anabolic steroids for females due to very low virilization effects in short-term usage. Of course, this is not a blanket-statement and individual results (dependent on doses and tolerance) will vary.

Methenolone is also not overly suppressive of the HPTA axis, although how suppressive is debatable. For this reason, many bodybuilders use it in between steroid cycles during their "off-time" to help maintain their gains and strength. The long term safety of such a practice possibly dangerous and can lead to permanent suppression of the HPTA.

Arnold Schwarzenegger is rumored to have introduced methenolone to the US bodybuilding community.

Primoplex is indicated in the treatment of refractory deficient red cell production anemias. These may include aplastic anemia, myelofibrosis, myelosclerosis, agnogenic myeloid metaplasia, and hypoplastic anemias caused by malignancy or myelotoxic drugs.

Primoplex is indicated in conditions such as chronic infections, extensive surgery, [corticosteroid-induced myopathy, decubitus ulcers, burns], or severe trauma, which require reversal of catabolic processes or protein sparing effects. These agents are adjuncts to, and not replacements for, conventional treatment of these disorders.

Primoplex (Methenolone Acetate) has been used in certain countries to counteract catabolic states, for example after major trauma.

[Anabolic Steroid Dianabol Turns 50](#)

The performance-enhancing drug Dianabol, which became the first widely used anabolic steroid and has built muscle for athletes and bodybuilders and become the subject of criminal prosecutions, was developed in 1958. There's a good piece in the New York Daily News looking at half a century of the steroid's use:

[The sport of bodybuilding](#)

The sport of bodybuilding The popular, growing sport of bodybuilding in the region is leading to bigger championships for local enthusiasts. Dana Ali, 31, who recently returned to Kurdistan from Britain, started lifting weights six year ago when he was abroad. "Oh, I became many pounds overweight," he said, taking a break after finishing the first set. "I see so many [overweight people] here, and I don't want to be like

them. "I feel better and forget about all my problems when I come in and exercise," said Ali, having arrived straight from work wearing a black T-shirt and leather gloves. He works out five times a week and has shed most of his body fat; his chest and biceps are as thick as they were when he was living in Britain.
