[The sport of bodybuilding](#)

The sport of bodybuilding The popular, growing sport of bodybuilding in the region is leading to bigger championships for local enthusiasts. Dana Ali, 31, who recently returned to Kurdistan from Britain, started lifting weights six year ago when he was abroad. "Oh, I became many pounds overweight," he said, taking a break after finishing the first set. "I see so many [overweight people] here, and I don't want to be like them. "I feel better and forget about all my problems when I come in and exercise," said Ali, having arrived straight from work wearing a black T-shirt and leather gloves. He works out five times a week and has shed most of his body fat; his chest and biceps are as thick as they were when he was living in Britain.

[Women On Prudent Dietary Pattern May Reduce Risk Of](#)

PRIMOPLEX 25 (Methenolone Acetate) Axiolabs

Substance: M
Manufactured by: Axiolabs
Packaging: 1 x 25 tabs (25mg/tab)
Average Dose: 50-150mg/day(M) 50-75mg/day(F)
Half Life: 4 - 6 hours
Water Retention: No
Aromatization: None
DHT Conversion: no

Primoplex 25 (methenolone acetate)

Indications **Primoplex** is indicated in the treatment of refractory deficient red cell production anemias. These may include aplastic anemia, myelofibrosis, myelosclerosis, agnogenic myeloid metaplasia, and hypoplastic anemias caused by malignancy or myelotoxic drugs.

Primoplex is indicated in conditions such as chronic infections, extensive surgery, [corticosteroid-induced myopathy, decubitus ulcers, burns] , or severe trauma, which require reversal of catabolic processes or protein sparing effects. These agents are adjuncts to, and not replacements for, conventional treatment of these disorders.

Primoplex (Methenolone Acetate) has been used in certain countries to counteract catabolic states, for example after major trauma.

Primoplex 25 (Primobolan) is one of those anabolic steroids which has a cult following not unlike the old original version of Masteron. Actually, as you can easily see from it 's anabolic:androgenic ratio below in the profile, it 's a pretty weak steroid but actually stronger(!) than Masteron in both regards. I don 't know anyone who has run both compounds at the same dose. We are probably justified in speculating that you 'd probably get similar results from either of them, when you consider the fact that you are getting quite a bit less actual drug and more ester when you choose injectable Primobolan (which has the very long Enanthate ester attached to it) over Masteron (which has the very short propionate ester attached to it). In truth, I think part of the reason many Primobolan users have been disappointed is that they failed to use enough of it, for long enough. From it 's chemical structure and anabolic:androgenic rating, we can assume it is at least as effective as Masteron, on an equal Mg for mg basis. However, due to its ester (in the injectable version), it needs to be run for at least 12 weeks to see the full benefits from it. When you consider a measly dose of 400mgs of this stuff for 12 weeks will probably cost you around \$500.

It 's easy to see why many people have tried to use less...and have been disappointed with their results. On the other hand, many competitive bodybuilders consider Primobolan indispensable to their pre-contest drud routine, and wouldn 't consider dieting without it. Anyway...I think the comparison to Masteron (another great precontest drug) is the best one we can make, with reference to expected gains and results.

I happen to be one of the few people who have used Drostanolone Enanthate (Masteron with the Enanthate ester attached) as well as Methenolone Enanthate (injectable Primobolan). I can tell you that the results from these two compounds, when ester and mg potency are the same, are in fact very similar.

Effects of Primoplex 25 (Primobolan)

Let 's flesh out some of the various general effects of Primobolan, before we get into the differences between the oral and injectable versions... One study performed on sheep involved administering 100mgs of Methenolone, and electronically stimulating their lats (electronic stimulation was used because they kept falling off the chin-up bars). Anyway, when compared with the lat muscles of sheep who didn 't receive Methenolone, the receiving group gained significantly more muscle mass as well as strength (1)(2). It 's also has a relatively high affinity for binding to the AR, actually binding better than testosterone (3). This ability to strongly bind to the AR may be why Primobolan is such a good "fat burner." Strong AR binding has been positively correlated with lypolysis (fat-burning) (8).

In addition, as this steroid can actually aid in reducing breast tumors, no ancillary products need be considered for use with Primobolan, and in fact, it may actually be a useful ancillary agent in it 's own right, similar to Masteron. Also, just like Masteron, **Primoplex 25 (Primobolan)** has no propensity to aromatize (convert to estrogen). Since it doesn 't aromatize, alot of the side effects commonly associated with estrogen will not be of concern. This means water retention, acne, and gyno will be non-existent more or less. this lack of water retention combined with the slow and steady gains

Death

Women On Prudent Dietary Pattern May Reduce Risk Of Death Women who eat a diet rich in vegetables, fruits, legumes, whole grains, fish and poultry may reduce their risk of death from cardiovascular disease and all causes. Women who follow a traditional "Western" diet of red and processed meat, refined grains, fries and sweets may increase their risk. That's the conclusion of researchers who reported the results of a Harvard School of Public Health study in Circulation: Journal of the American Heart Association. The study of 72,113 healthy women found that high adherence to the "prudent" dietary pattern was associated with a 28 percent lower risk of death from cardiovascular disease and a 17 percent lower risk of premature death from all causes when compared to the lowest adherence.

provided by Primo may help to explain why it has earned a reputation for creating quality muscle gains. This also helps to explain why it is so expensive. Although estrogenic sides are not a concern, hair loss still, remains a very real concern with Primobolan, as with many DHT-Derived steroids. Many primobolan fans always include Finasteride and Ketoconazole (shampoo) in cycles containing Primobolan.

Although nobody would ever suggest to use **Primoplex 25 (Primobolan)** as a bulking agent, it's been studied as an agent to halt wasting and possibly reverse many of the adverse effects of anemia. It is a shocking failure in both areas, according to some of the case studies I've read, (5)(6) and this should come to no surprise to anyone. Anadrol reigns supreme in this area, and nobody in the athletic community would ever compare those two drugs. However, Michael Mooney and many other respected doctors who work with AIDS patients have found sufficient evidence to claim that Primobolan is an immune enhancer and as such is very useful for AIDS patients (not that the FDA cares...Primobolan is still not approved for sale in the United States). AIDS patients aren't really in need of Bulking Drugs, so an immune enhancer like Primo which will add small, quality gains in muscle is perfect for them. And since we aren't even going to vaguely consider the use of Primobolan as a bulking agent, clearly this leaves us with considering it primarily for use in gaining and maintaining lean tissue. It's a great choice for this purpose, and many competitors have used it very successfully to retain muscle while on a calorie reduced diet. The reason Primo is so useful for this purpose is that one of its primary functions is to help your body retain nitrogen (7) at a greatly enhanced rate. The greater your nitrogen retention is, the more muscle you will build. In the case of using primo as a pre-contest drug, this nitrogen retention will help you retain muscle and ensure that your dieting preferentially favors fat loss over muscle loss.

Primoplex 25 (Primobolan) is a very unique steroid, as it is one of the few that comes in both an oral as well as an injectable version. I suppose Winstrol does also, but Primobolan actually has a different ester on the oral (acetate) and injectable (Enanthate) versions. The oral version is one of the more interesting oral compounds I've looked into. For starters, it's one of the few compounds available to athletes and bodybuilders which is both oral as well as non-17-alpha-alkylation. This alteration is (as I'm sure you remember from other stuff I've written) what generally makes oral steroids survive their first pass through your liver, but also makes them Hepatotoxic (Liver toxic). Well... oral Primo doesn't have this feature, so it is very mild on your liver (actually it basically isn't liver toxic at all), but also is largely destroyed by it, since 17 beta estrification and 1 alkylation is the method used to make this stuff orally available. You'll need to take a lot of this stuff for it to be effective... 100mgs/day of the oral version is a safe estimate for reasonable gains& for women, you could get away with less; perhaps 25mgs/day. Even though the acetate ester has a 2-3 day active life, your liver will do some damage to oral primo, so every day dosing will still be necessary.

When men were given a 30-45mg dose of the oral version of Primo, they experienced a 15-65% decrease in gonadotropin levels (9). Remember, I said 100mgs is a good dose for gains... well, you'll also reduce your gonadotropin levels considerably. I have personally never understood why people recommend either oral or injectable Primobolan as a possible bridging compound for this reason... maybe at a too-low-to-do-anything dose of 10mgs it could be used as a bridge. And forget about using injectable Primo to bridge&

Hey... speaking about injectable Primo...

I've used this stuff at 200mgs/week and wasn't very impressed with it. Generally, I think injectable primo needs to be used at a dose of at least 350mgs/week (100mgs/Every other Day), and preferably at a dose of 400-600mgs/week. I happen to like running it with testosterone propionate, but for convenience I would imagine most people would run it with Testosterone Enanthate, to keep dosing times the same (shooting it twice per week, in most cases).
