[Anabolic Steroid Dianabol Turns 50](#)

The performance-enhancing drug Dianabol, which became the first widely used anabolic steroid and has built muscle for athletes and bodybuilders and become the subject of criminal prosecutions, was developed in 1958. There's a good piece in the New York Daily News looking at half a century of the steroid's use:

Substance: Chlorodehydromethyltestosterone
Manufactured by: Axiolabs
Packaging: 100 tabs, each tab 10mg
Average Dose: 20mg per day
Half Life: 8 hours
Water Retention: minimal to zero
Aromatization: No
DHT Conversion: none

Turanaplex is indicated in conditions such as chronic infections, extensive surgery, [corticosteroid-induced myopathy, decubitus ulcers, burns] , or severe trauma, which require reversal of catabolic processes or protein-sparing effects. These agents are adjuncts to, and not replacements for, conventional treatment of these disorders.

Turanaplex has a predominantly anabolic effect which is combined with a relatively low androgenic component. On a scale of 1 to 100 the androgenic effect is very low only a 6- and the anabolic effect is 53. (In comparison: the androgenic effect of Dianabol is 45 and its anabolic effect is 90.) Oral-Turanaplex thus has milligram for milligram a lower effect than Dianabol. It is therefore not a steroid that causes a rapid gain in strength, weight, and muscle mass. Rather, the achievable results manifest themselves in a solid muscle gain and, if taken over several weeks, also in a good strength gain. The athlete will certainly not get a puffy look as is the case with Testosterone, Dianabol, and Anadrol 50. The maximum blood concentration of Oral-Turinabol when taking 10, 20 or 40 mg/day is 1.5 -3.5 or 4.5 times the endogenous testosterone concentration (also see Dianabol). This clearly shows that the effectiveness of this compound strongly depends on the dosage.

$0.4 \times \text{pound (body weight)} \times \text{days} = \text{number of tablets to take overall during the interval of intake mg / tablet}$

An athlete weighing 200 pounds would take only 2 tablets of 10 mg (20mg/day.) Bodybuilders take 8-10 tablets of 5 mg, that is 40-50 mg/day. Many enthusiastically report good results with this dosage: one builds a solid muscle mass, the strength gain is worthwhile seeing, the water retention is very low, and the estrogen caused side effects are rare. Not without good reason **Turanaplex** is also popular among powerlifters and weightlifters who appreciate these characteristics.

Due to its characteristics Turanaxplex is also a suitable steroid both for men and women in competitions. A usually very effective stack for male bodybuilders consists of 50 mg OT/day, 228 mg Parabolan/week, and 150 mg Winstrol Depot/week. Those who have brought their body fat content to a low level by dieting and/or by using fatburning substances (e.g. Clenbutaplex, Ephedrine, Salbutamol, Cytomel, Triacana), will find that the above steroid combination will manifest itself in hard, sharply defined but still dense and full muscles. No enlarged breasts, no estrogen surplus, and no watery, puffy looking muscle system. If OT were available on the U.S. black market for steroids, bodybuilders, powerlifters, and weightlifters would go crazy for this East German anabolic.

Turanaplex enjoys a great popularity since it is quickly broken down by the body and the metabolites are excreted relatively quickly through the urine. The often posed question regarding how many days before a test OT can be taken in order to be "clean" is difficult to answer specifically or in general. We know from a reliable source that athletes who only take OT as a steroid and who, in part, take dosages of 10- 15 tablets/day, have discontinued the compound exactly five days before a doping test and tested negative. These indications are supported by the fact that even positive urine analyses have rarely mentioned the names Oral-Turanaplex or chlordehydromethyl-testosterone.

The potential side effects of **Turanaplex** usually depend on the dosage level and are gender-specific. In women, depending on their predisposition, the usual virilization symptoms occur and increase when dosages of more than 20 mg per day are taken over a prolonged time. In men the already discussed reduced testosterone production can rarely be avoided. Gynecomastia occurs rarely with OT. Since the response of the water and electrolyte household is not overly distinct athletes only rarely report water retention and high blood pressure. Acne, gastrointestinal pain, and uncontrolled aggressive behavior are also the exception rather than

the rule with **Turanaplex**. An increased libido is reported in most cases by both sexes. Since the substance chlordehydromethyltestosterone is 17-alpha alkylated the manufacturer in its package insert recommends that the liver function be checked regularly since it can be negatively affected by high dosages and the risk of possible liver damage cannot be excluded. Thus Turanaxplex is also a steroid that can be taken without interruption for long intervals. Studies of male athletes who over a period of six weeks were given 10 mg OT/day did not show any indications of health-threatening effects.

based on her "Fitness Revolution for Kids" program, a new approach built on the belief that kids can find success and even fun getting fit through positive motivation and by connecting mind, body and spirit. Fitness Revolution for Kids is a playful, high-energy workout for children ages 5 and up. It is now available at <http://www.revolutionforkids.com> for \$19.99. "The Revolution is designed to give today's amazing children the tools they need to create their own generation of health," Byrne said. "We empower kids and their families by accepting the good things about them. When kids are feeling healthy and strong, their positive contributions to the world are limitless."
